

[ABSTRACT OF THE DISCLOSURE]

1998-35708

[ABSTRACT]

A washing machine is disclosed, in which the washing machine has an excellent pumping efficiency as washing water going up to the interval of inner and outer tubs is smoothly guided by upper and lower tub covers and has a better washing efficiency as washing water provided to the inner tub goes to the outer part of the inner tub and prevented from splashing out of the outer tub. A tub cover of a washing machine includes an inner rounding face for guiding the washing water of a lower tub cover, an outer rounding face being formed on an upper cover for preventing the washing water from splashing out of the washing machine, a guide rib being formed between the inner and outer rounding faces for forming a flow passage to which the washing water is provided, and a fastening means.
